GETTING STARTED GUIDE · BETA · v0.3

ewave

Save. Spend. Move Money. Globally.

Borderless finance for Africans, powered by stablecoins.

🛡️ Secure by design 🌍 Global access 💠 Stablecoin powered ⚡ Fast & low cost

📄 Getting Started Guide ⏱️ 7 min read 🌍 7 African countries 👥 10,000+ users

// 01 — Overview

What is ewave?

ewave is a stablecoin payments platform built for Africa. Hold, send, receive, and convert digital dollars — and withdraw to your local bank account — in seconds. With over 10,000 users across the continent, ewave covers everything from personal remittances to freelancer payouts to business payments.

The core product is both an off-ramp and on-ramp: convert stablecoins to local currency, or buy stablecoins with local currency. Beyond that, ewave adds bill payments, stablecoin savings with yield, payment links, and virtual and physical debit cards — all in one platform.

ewave is currently in beta with zero transaction fees. The beta app is live at beta.useewave.com.

// 02 — Features

What you can do on ewave

ewave covers eight core finance modules. Start with one and expand as your needs grow.

💸 **Store & Send**	Hold and transfer digital dollars instantly — borderless, with full control over your funds.
🏦 **Withdraw Locally**	Convert stablecoins to local currency and withdraw to your bank account or mobile money.
💡 **Pay Bills**	Pay airtime, internet, electricity, and cable TV directly in stablecoins.
📈 **Save & Earn Yield**	Save in stablecoins and earn yield. Protect your savings from local currency inflation.

🛒 **Buy Stablecoins**	Top up your ewave wallet from your local bank account or mobile money at competitive rates.
🔗 **Payment Links**	Get paid with a shareable link — no wallet address needed.
💳 **Virtual & Physical Cards**	Spend stablecoins anywhere with linked debit cards at card-accepting merchants.
💬 **WhatsApp Bot**	Manage your wallet through WhatsApp commands. Coming soon.

`// 03 — Use Cases`

Who ewave is built for

ewave is designed around four types of users moving value across Africa.

01 Freelancers

Get paid globally in stablecoins and withdraw locally in seconds. No more waiting days for international wire transfers.

02 Creators & Influencers

Earn in dollars, receive in stablecoins, cash out to your local bank. Zero currency conversion friction.

03 Remote Workers

Receive your salary in stablecoins without bank delays. Your employer pays in crypto, you receive in cash.

04 Everyday Users

Send money to family and friends across Africa securely, instantly, and without expensive transfer fees.

`// 04 — Supported Assets`

Supported assets, currencies & networks

ewave supports three stablecoins across multiple blockchain networks, with local currency payouts across seven African markets.

Asset	Type	Networks	Payout Currencies
USDT	USD-pegged stablecoin	Base · BSC	NGN · KES · GHS · more
USDC	USD-pegged stablecoin	Base · BSC	NGN · KES · GHS · more
CNGN	Compliant Naira stablecoin	Base · BSC	NGN

> 🔗 **What is CNGN?**
> CNGN (Compliant Nigerian Naira) is a regulated, naira-backed stablecoin — 1 CNGN = ₦1. It runs on Base and BSC. If you hold CNGN from a DeFi protocol or another wallet, ewave lets you swap it directly back to naira with a single click.

`// 05 — Coverage`

Supported countries

ewave currently operates across seven African markets, with expansion underway.

🇳🇬 Nigeria	🇰🇪 Kenya	🇬🇭 Ghana	🇷🇼 Rwanda
🇿🇦 South Africa	🇨🇲 Cameroon	🇺🇬 Uganda	

> 🌍 **Expanding across Africa**
> ewave is built for 54+ countries and continues to add new markets. Follow @Ewavefin on X or visit useewave.com for the latest coverage announcements.

`// 06 — Requirements`

Before you start

Have these ready before initiating your first swap:

1. **A crypto wallet with USDT, USDC, or CNGN**
   Your wallet must hold the asset on a supported network (Base or BSC). Compatible wallets include MetaMask, Trust Wallet, and any Base/BSC-compatible wallet.
2. **A bank account in a supported country**
   Have your bank account number and bank name ready. ewave pays out in local currency — NGN, KES, GHS, etc. — depending on your market.
3. **A stable internet connection**
   Swaps are confirmed on-chain. A dropped connection mid-transaction can cause delays — ensure your connection is stable before starting.

// 07 — Step-by-step

How to make your first swap

The full process takes under a minute. Here is what it looks like:

4. **Visit beta.useewave.com**
   Open the ewave app in your browser. No account signup required to see live rates and initiate a swap.
5. **Enter the amount you want to convert**
   Type in how much USDT, USDC, or CNGN you want to swap. The interface shows the exact local currency you will receive before you commit.
6. **Select your bank**
   Choose your bank from the dropdown and enter your account number. ewave supports banks across all seven operating countries.
7. **Click "Exchange swiftly!" and send your crypto**
   Review the summary — amount, rate, destination bank — then confirm. ewave generates a receiving wallet address. Send the exact amount on the correct network.
8. **Receive your local currency**
   Once your on-chain transfer is confirmed, ewave sends the local currency to your bank. This typically completes within 10 seconds.

⚠️ **Critical:** Always send the exact amount shown, on the correct network. Sending on the wrong chain (e.g., ERC-20 USDT to a BSC address) results in a lost transfer. Blockchain transactions cannot be reversed — double-check before confirming.

// 08 — Limits

Transaction limits

ewave supports a generous per-swap ceiling suitable for both casual use and larger off-ramp needs.

$5,000	**Maximum per transaction** Swap up to $5,000 worth of stablecoins in a single exchange. For larger amounts, split across multiple swaps. Minimum shown on the live interface.

✦ **Zero fees during beta**
ewave currently runs with zero transaction fees on the beta platform. This may change at full launch — always check the live interface for current fee information before swapping.

// 09 — Security

Security & trust

ewave is built on bank-grade security infrastructure with full on-chain transparency and regulatory compliance across all operating markets.

🔒 **End-to-End Encryption**	256-bit encryption protects your assets and data at every step.
🔍 **On-Chain Transparency**	All transactions are publicly verifiable on the blockchain — no hidden fees or movements.
🗝️ **Self-Custody**	You hold your funds — not ewave. Your wallet, your keys, your control.
📋 **Regulatory Compliance**	Built with global and local financial regulations across all seven operating markets.
✅ **Audited Smart Contracts**	Independently verified for security and reliability by third-party auditors.
🤝 **Regulated Partners**	Works exclusively with licensed and compliant payment providers globally.

// 10 — WhatsApp Bot

WhatsApp bot

ewave is building a WhatsApp AI agent that will let you send and receive stablecoins, check rates, and manage your wallet entirely through WhatsApp — no app download required.

> 🚧 **Coming Soon**
> The WhatsApp bot is currently in development and not yet publicly available. When it launches, use simple commands like /send to transfer money and confirm transactions with a PIN. Visit useewave.com/ewave-whatsapp.html or follow @Ewavefin on X to get notified at launch.

// 11 — FAQ

Frequently asked questions

Q What stablecoins does ewave support?

ewave supports USDT (Tether), USDC (USD Coin), and CNGN (Compliant Naira). USDT and USDC are dollar-pegged — 1 token ≈ $1. CNGN is naira-pegged — 1 CNGN = ₦1.

Q Which blockchain networks does ewave support?

ewave currently supports Base and BNB Smart Chain (BSC) for all three stablecoins. Always confirm the correct network on the swap interface before sending.

Q Which countries does ewave operate in?

Nigeria, Kenya, Ghana, Rwanda, South Africa, Cameroon, and Uganda. More African markets are being added — check useewave.com for the latest.

Q What is the maximum I can swap at once?

The current per-transaction maximum is $5,000. For larger amounts, split across multiple swaps.

Q Does ewave charge fees?

Zero transaction fees during the beta period. Fee structure at full launch may differ — always check the live interface before swapping.

Q How long does a payout take?

ewave targets a 10-second payout from the moment your on-chain transfer is confirmed. Actual timing may vary with network congestion or your bank's processing speed.

Q Can I also buy stablecoins on ewave?

Yes. ewave is both an on-ramp and off-ramp. Buy USDT or USDC from your local bank account or mobile money wallet at competitive rates.

Q What is CNGN and why would I use it?

CNGN is a regulated naira-backed stablecoin on Base and BSC. If you receive CNGN from a DeFi protocol, swap it directly to naira on ewave — no need to convert to USDT first.

Q Is the WhatsApp bot available now?

Not yet. It is currently in development. Visit useewave.com/ewave-whatsapp.html to register for launch notification.

Q What if my bank does not receive the payout?

Check your transaction history at beta.useewave.com/history. If the issue persists, contact ewave support via X (@Ewavefin) or WhatsApp at +234 705 281 2874.

Q Is ewave self-custodial?

Yes. ewave is built on a self-custody model — you hold your own funds and keys. ewave does not custody your assets on your behalf.

Quick glossary

New to crypto? Here are the key terms you will encounter on ewave.

Stablecoin	A cryptocurrency pegged to a fixed value — usually $1 or ₦1. Does not swing wildly like Bitcoin. USDT, USDC, and CNGN are all stablecoins.
USDT	Tether. The most widely traded stablecoin globally. 1 USDT = $1. Available on Base, BSC, and many other chains.
USDC	USD Coin by Circle. Pegged 1:1 to the US dollar. Backed by real dollar reserves. Widely used for international payments.
CNGN	Compliant Nigerian Naira — a regulated, naira-backed stablecoin. 1 CNGN = ₦1. Runs on Base and BSC.
Off-ramp	Converting crypto into local fiat currency and withdrawing to a bank account. ewave is primarily an off-ramp.
On-ramp	Buying crypto using local fiat currency. ewave also supports this — buy USDT or USDC from your bank account.
Base	A fast, low-fee blockchain built by Coinbase on Ethereum's infrastructure. One of the two networks ewave supports.
BSC	BNB Smart Chain — Binance's blockchain. Known for low fees and wide stablecoin support. Also supported by ewave.
Self-custody	A wallet model where you — not a company — hold your own private keys and control your funds.
Payment link	A shareable URL that lets anyone send you stablecoins without needing your wallet address.
Yield	Interest earned on your stablecoin balance. ewave's Save & Earn feature lets your digital dollars grow while stored.
NGN	Nigerian Naira — local fiat currency for Nigerian bank payouts.
KES	Kenyan Shilling — local fiat currency for Kenyan bank payouts.
GHS	Ghanaian Cedi — local fiat currency for Ghanaian bank payouts.
Wallet address	A long string of characters that works like a bank account number for crypto. Always send to the address ewave generates, on the correct network.
